PROMPT PACK 01

# 6 CLAUDE PROMPTS THAT EDIT MY REELS

The exact prompts behind every effect in the reel. One prompt each, pasted into Claude Code.

@brodyautomates

BEFORE YOU START

# HOW TO USE THESE

1 **Make a Remotion project.**
Run `npx create-video@latest` and open the folder.

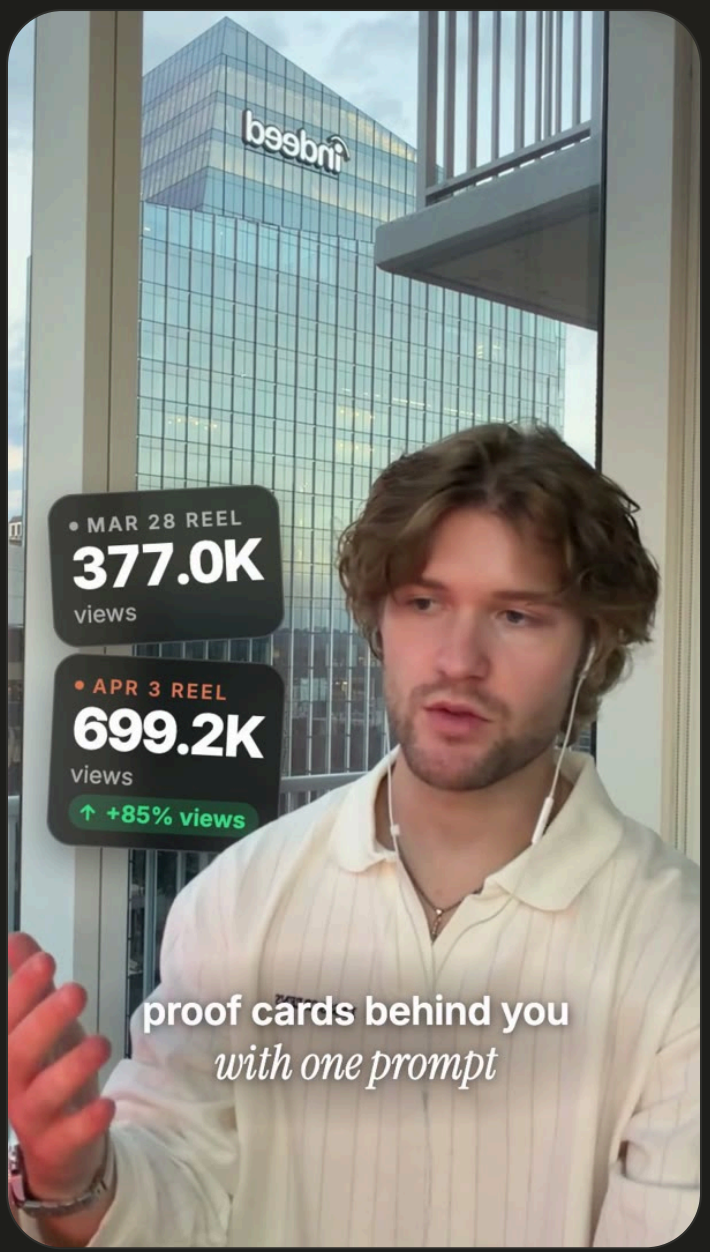

2 **Drop your clip in.**
Save your talking head as `clip.mp4` in that folder.

3 **Open Claude Code there.**
Run `claude` in the same folder.

4 **Paste one prompt.**
Swap anything in **{curly braces}** for your own words or numbers.

5 **Preview and render.**
Run `npx remotion studio` to watch it, then render.

**One rule.** Only use numbers you can screenshot. The prompts read them from a file so Claude never makes them up.

01/06

# /over-the-shoulder

Puts two of your real numbers on glass cards that rise from behind your shoulders, with you cut out in front.

YOU NEED

Your clip, two numbers from a screenshot you saved, Remotion project.

THE PROMPT

paste into Claude Code

```
Build a Remotion component OverShoulder for my talking head
clip at ./clip.mp4.
Use person segmentation to make a per frame matte of me,
then draw two dark glass cards BEHIND the matte so my
shoulders overlap their bottom edge.
Card bottoms sit on my shoulder line (face box bottom + 0.55
x face height). Left card: {before}. Right card: {after},
its number counts from the left value to its own over 24
frames with an ease out, then a green delta pill pops in.
Never put any card pixel over my face or hair. Read the
numbers from ./numbers.yaml, never invent them.
```

02/06

# /glass-graph

**A frosted glass bar chart on your chest that climbs to your real number.**

YOU NEED

Your clip, 3 to 10 real values and a total, Remotion project.

THE PROMPT

paste into Claude Code

```
Build a Remotion component GlassChart over ./clip.mp4.
Detect my face every frame and place a frosted glass card
(backdrop blur 22px, white 20% to 6% gradient, 2px white
border) on my chest with its top at least 40px below my chin
on every frame.
Inside: title "{title} · {period}", a big number counting
from 0 to {total} with an ease out, and bars from
./chart.yaml that spring up one after another.
Only use green for positive changes. Read every value from
./chart.yaml.
```

03 / 06

# /freeze-frame

Freezes on your gesture, cuts you out as a white outlined sticker and adds a name tag.

YOU NEED

A clip where you give a thumbs up, Remotion project.

THE PROMPT

paste into Claude Code

```
In ./clip.mp4 find the frame where my thumbs up peaks (hand pose detection). Build a Remotion component that plays to that frame, flashes white, freezes, greys and blurs the background, and pops my cutout forward as a sticker: white 14px outline from the matte, soft drop shadow, tilted -2.5 degrees.
Add a coral name tag under my chin that says my name and role, never over my face or my hand. Hold 1.3 s, then fade the sticker and resume the clip.
```

04 / 06

# /tier-list

Asks Claude to rank a list of tools, then animates the result as an S to D tier list under your chin.

## YOU NEED

Your clip, the list you want ranked, the real logo files, Remotion project.

## THE PROMPT

paste into Claude Code

```
Step 1: rank these for my audience, tiers S to D, one line why each: {items}. Save the answer to ./tiers.md exactly as written.
Step 2: build a Remotion component TierList over ./clip.mp4. Shift the footage up so my face sits in the top third, then put a dark glass panel below my chin with five coloured tier rows. Tiles fly in from the right one by one using the logo files in ./logos/ (never draw logos). The S tier lands last with a glow. A pill above the panel reads "Ranking ..." then "Ranked" with a check.
```

05 / 06

# /text-behind

**Puts a huge word behind your head, with your head in front of it and every letter still readable.**

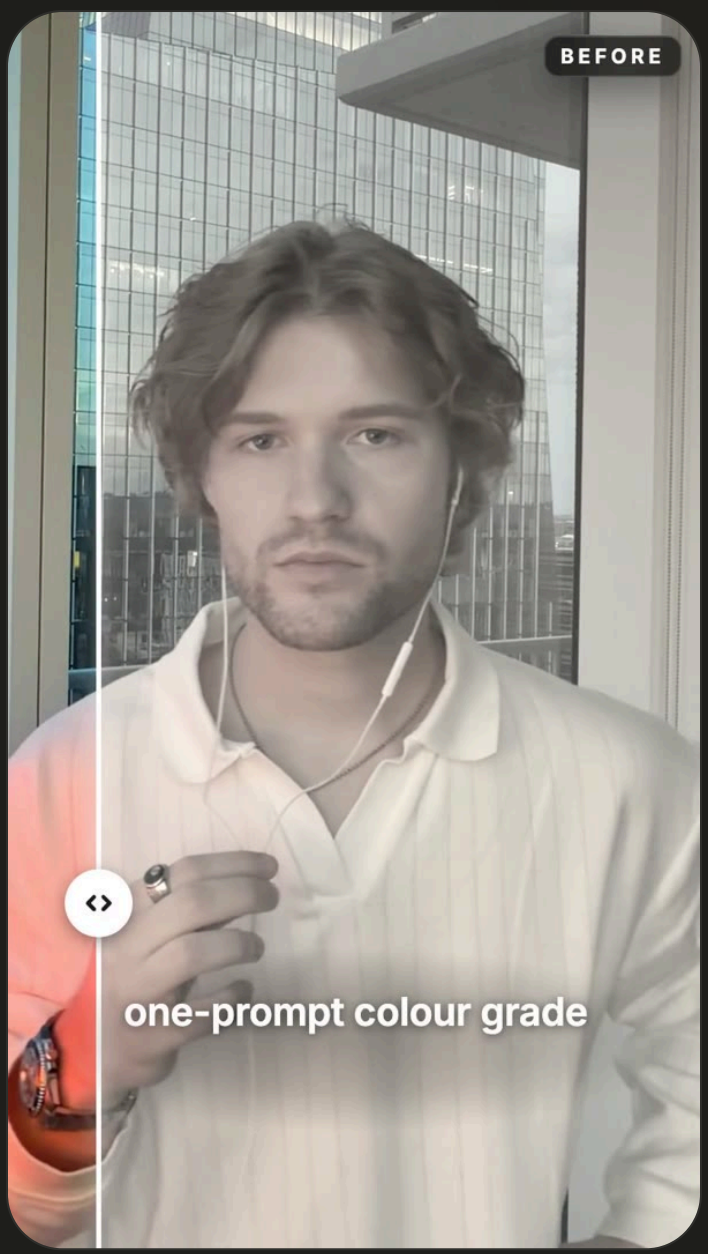

YOU NEED

Your clip, a word of 2 to 5 characters, Remotion project.

THE PROMPT

paste into Claude Code

```
Build a Remotion component TextBehind over ./clip.mp4 with
the word "{word}".
Make a per frame person matte. Size the word (Archivo,
condensed, weight 900) as large as fits 750px wide, then
place it so the top of my head overlaps no more than 20% of
the letters' height on the worst frame, shifting the footage
down if needed. Draw order: clip, word, my cutout. The word
rises from behind my head over 13 frames, then stays still.
Check every letter is at least 70% visible on every frame
and tell me if not.
```

06 / 06

# /color-grade

**Wipes your flat footage into a cinematic grade with BEFORE and AFTER pinned to their sides.**

## YOU NEED

Your clip and a graded copy of it (or let the prompt make a draft grade), Remotion project.

## THE PROMPT

paste into Claude Code

```
Build a Remotion component GradeWipe. Bottom layer:
./clip.mp4 (flat). Top layer: ./clip.graded.mp4 (if it does
not exist, make a draft with saturate 1.18, contrast 1.1,
brightness 0.98), clipped left of a vertical white divider
that sweeps left to right over 32 frames.
Put a round handle on the divider at shoulder height, an
AFTER chip top left and a BEFORE chip top right that fades
out before the divider reaches it. Keep everything inside
the frame.
```

THAT'S ALL SIX

# POST WHAT YOU MAKE

Tag me in it. I share the best ones.

New packs drop on my page every week.
